Course Code:DSA0308

Slot: D

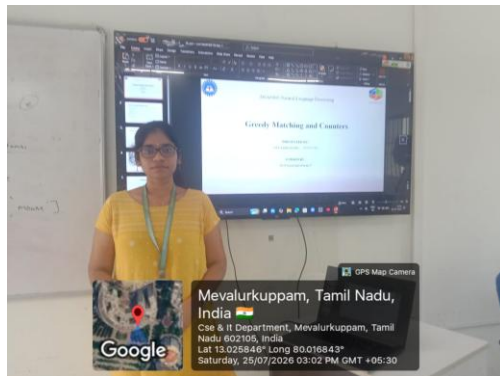

Course Name: Natural Language Processing

Course Faculty: Dr. T Kumaragurubaran

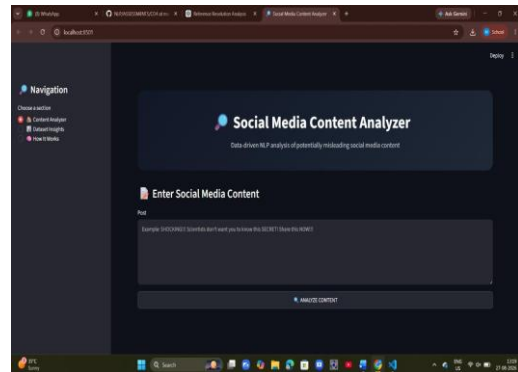

Project Title: Social Media Manipulative Content Detection and Risk Assessment Using NLP

Module Photographs:

Presentation Image

Implementation

Project Description:

- ✓ Social media has become a major platform for sharing news, opinions, alerts, and information.
- ✓ However, online content can use emotionally charged, sensational, urgent, or exaggerated language to influence user behavior.
- ✓ Such communication may encourage users to click links, share information, or take immediate action without careful verification.
- ✓ This project develops a Social Media Manipulation Analyzer that examines the linguistic characteristics of social-media content.
- ✓ The system analyzes two types of input: social-media posts and messages associated with links.
- ✓ It identifies patterns such as emotional language, sensationalism, urgency, excessive capitalization, punctuation, calls-to-action, and suspicious requests.
- ✓ A machine-learning component using TF-IDF and classification algorithms provides additional text classification support.
